Barry

The Example

```
auto main() -> int {

}
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
}
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::istream<int>(input)) {
        print("loop: {}\n", i);
    }
}
```

```
loop: 1
loop: 2
loop: 3
loop: 4
loop: 5
loop: 6
loop: 7
loop: 8
loop: 9
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::take(views::istream<int>(input), 5)) {
        print("loop: {}\n", i);
    }
}
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::istream<int>(input)
                | views::take(5)) {
        print("loop: {}\n", i);
    }
}
```

The Example

```
auto main() -> int {
    istringstream input("1 2");
    for (int i : views::istream<int>(input)
               | views::take(5)) {
        print("loop: {}\n", i);
    }
}
```

```
loop: 1
loop: 2
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::istream<int>(input)
                | views::take(5)) {
        print("loop: {}\n", i);
    }
}
```

```
loop: 1
loop: 2
loop: 3
loop: 4
loop: 5
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::istream<int>(input)
                | views::take(5)) {
        print("loop: {}\n", i);
    }

    int next;
    if (input >> next) {
        print("next: {}\n", next);
    }
}
```

```
loop: 1
loop: 2
loop: 3
loop: 4
loop: 5
next: ?
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::istream<int>(input)
                | views::take(5)) {
        print("loop: {}\n", i);
    }

    int next;
    if (input >> next) {
        print("next: {}\n", next);
    }
}
```

```
loop: 1
loop: 2
loop: 3
loop: 4
loop: 5
next: 6
```

The Example

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::istream<int>(input)
                | views::take(5)) {
        print("loop: {}\n", i);
    }

    int next;
    if (input >> next) {
        print("next: {}\n", next);
    }
}
```

```
loop: 1
loop: 2
loop: 3
loop: 4
loop: 5
next: 7
```

take(5): the search for the missing 6

```
auto main() -> int {
    istringstream input("1 2 3 4 5 6 7 8 9");
    for (int i : views::istream<int>(input)
               | views::take(5)) {
        print("loop: {}\n", i);
    }

    int next;
    if (input >> next) {
        print("next: {}\n", next);
    }
}
```

```
loop: 1
loop: 2
loop: 3
loop: 4
loop: 5
next: 7
```

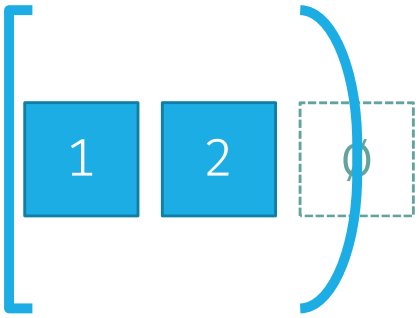
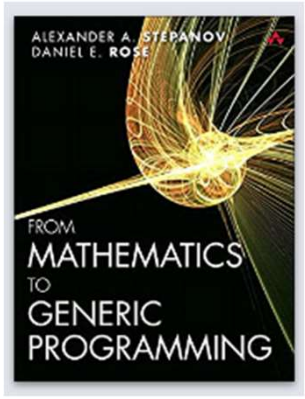
template <class I>
void destroy(I first, I last);
```



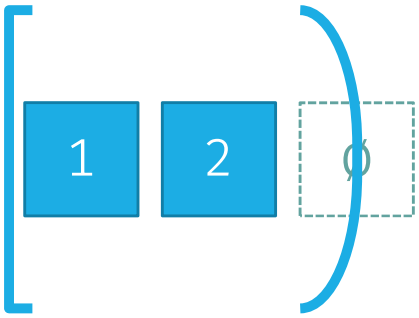
```
template <input_iterator I, sentinel_for<I> S>
void destroy(I first, S last);
```



The Law of Useful Return, Revisited

When writing code, it's often the case that you end up computing a value that the calling function doesn't currently need. Later, however, this value may be important when the code is called in a different situation. In this situation, you should obey the *law of useful return*:

> *A procedure should return all the potentially useful information it computed.*



```
template <input_iterator I, sentinel_for<I> S>
auto destroy(I first, S last) -> I;
```

2471. `copy_n`'s number of `InputIterator` increments unspecified

Section: 27.7.1 [alg.copy] **Status:** Open **Submitter:** Jonathan Wakely **Opened:** 2015-01-28 **Last modified:** 2018-06-22

Discussion:

It's unspecified how many times `copy_n` increments the `InputIterator`. `uninitialized_copy_n` is specified to increment it exactly `n` times, which means if an `istream_iterator` is used then the next character after those copied is read from the stream and then discarded, losing data.

I believe all three of Dinkumware, libc++ and libstdc++ implement `copy_n` with `n - 1` increments of the `InputIterator`, which avoids reading and discarding a character when used with `istream_iterator`, but is inconsistent with `uninitialized_copy_n` and causes surprising behaviour with `istreambuf_iterator` instead, because `copy_n(in, 2, copy_n(in, 2, out))` is not equivalent to `copy_n(in, 4, out)`

This is a mess. Append to Effects: If the InputIterator is not a forward iterator, increments n-1 times. Otherwise the number of increments is not more than n. (ncm) The preceding proposition is unsatisfactory, because it is wrong for istreambuf_iterator, which is much more useful than istream_iterator. Proposing instead: Append to Effects: If InputIterator is istream_iterator for some T, increments n-1 times. Otherwise, increments n times. Want a paper exploring what the implementations actually do, and what non-uniformity is "right".

`istream_iterator(istream_type& s);`

4 *Effects*: Initializes `in_stream` with `addressof(s)`, value-initializes `value`, and then calls `operator++()`.

`istreambuf_iterator(istream_type& s) noexcept;`

3 *Effects*: Initializes `sbuf_` with `s.rdbuf()`.

Bonus Example

```
auto main() -> int {
    for (int i : views::iota(0)
               | views::filter([](int i){ return i < 5; })
               | views::take(5)) {
        print("{}\n", i);
    }
}
```

```
auto main() -> int {
    for (int i : views::iota(0)
                | views::filter([](int i){ return i < 5; })
                | views::take(5)) {
        print("{}\n", i);
    }
}
```

```
auto main() -> int {
    for (int i : views::iota(0)
                | views::filter([](int i){ return i < 5; })
                | views::closed_take(5)) {
        print("{}\n", i);
    }
}
